

If your cargo requires a temperature controlled environment our Gensets are an excellent, reliable, and cost effective solution to meet your needs.

Gensets are portable diesel fueled generators used to power refrigerated containers. They can be used when reefers are carried on chassis as well as rail cars. When a reefer is carried on a containership, it is usually plugged into the containership's main power supply. Our current fleet includes approximately 7,300 generator sets, which account for approx 2% of our container fleet units.
